To Whom It May Concern

HP has engaged Fusion Software Engineering Pvt. Ltd. (and its affiliate Ramsoft Technologies) for various software development initiatives since 1990. We recently retained the services of Fusion Software for a large project to re-engineer the Citibank Payment Services (CPS) for Citibank, USA.

In Citibank, CPS is an application front-end to internal payment and accounting systems for funds transfer through Checks, Wires and Automated Clearing Houses. CPS also provides financial information, consolidation/reporting and EDI translation services.

The re-engineering project was conceived to overcome the limitations of Citibank's current payments system i.e. limited scope for technology adaptation, lack of documentation, poor expandability, narrow US domestic payments focus and other technical constraints of a legacy system.

Our mandate to Fusion included conducting a study to re-engineer the current system into an object oriented, client server based system. The functionality required included a Global multi-currency payments capability, volume scalability, dynamic scheduling, automated billing, automated logging for effective MIS etc. The overall project exceeds 650 person-months.

Fusion Software has successfully completed the initial three phases of the project on schedule and meeting the quality requirements. These completed phases include detailed review of the current system processes, definition of the solution architecture and functional analysis/high level design of the proposed system.

Over the past few years, we have been very satisfied with Fusion Software's technical expertise and participation in our projects in general. Specifically in Citibank's CPS initiative, Fusion has contributed significantly by deploying senior professionals at a very short notice, grasping the intricacies of the existing system and providing valuable technical insight into the proposed system design. Also, Fusion has shown very good coordination between its team in US and India, Citibank in Delaware and HP.

We look forward to retaining their services in future, should appropriate opportunities arise.

A Project Centre Manager says

TO WHOMSOEVER IT MAY CONCERN

The domestic activity of Fusion Software Engineering; Ramsoft Technologies have been involved in software development projects for HP-ISO for over 4 years. Some of the projects where we have utilised their services and which were executed successfully are : Development of Instrument Drivers, Design and Development of Automated Test Suites and Libraries for testing VLSI Devices. Currently they are involved in the Design and Development of an SNMP Driver.

We have found their engineers to be technically competent and quality conscious with sound software engineering skills. They are committed to their schedules and have completed the projects on time.

We are fully satisfied with their performance and will not hesitate to use their skills in future.
